

Coverage of the Environmental Problem in the Media

Khayriniso Jurayeva Shavkat kizi

Samarkand State Institute of Foreign Languages, Faculty of Oriental Languages, Student of international journalism

Abstract: *In this article, you can find information about people getting sick due to hot and cold weather when changes in the four seasons of nature are observed, information about people who died from such a situation, how environmental problems are covered in the media, and solutions to these situations.*

Keywords: *environment, cancer, drought, seasons, anomalous cold, atmospheric damage, gases and substances.*

INTRODUCTION

Every season of today's paradise country is different and words cannot describe this beauty. May there always be blessings to our country, which is not equal to other countries of the world. But sometimes there are some shortcomings observed in our country in the name of eco-environment. It is the duty of eco-journalists to openly and transparently show environmental disasters.

LITERATURE ANALYSIS AND METHODOLOGY

Now, with the arrival of spring, we can see the warming of the days and the drying of the land due to the hot weather in many areas. Of course, Uzbekistan is a heavenly country. Seasons are always in their place and the freshness of these seasons always gives a person special peace.

However, for how many years we can witness the change of these seasons or extreme changes in the seasons. For example, in Uzbekistan, since 4 years, apricots have not been harvested in some regions, and the reason for this is that in the spring, the return of winter causes severe cold and wind to drop the blossoms of trees. From this phenomenon, we know that the shedding of flowers on a tree that has just blossomed is a sign that the tree will not bear fruit.

Another example is that this year's winter was colder than every other year, which caused a lot of unpleasant events to occur. That is, as a result of severe cold, hospitals froze and many newborn babies died due to extremely cold air pressure.

It is also not recommended to consume alcohol and tobacco during abnormal cold. Because in such a case, the blood vessels narrow sharply and can cause freezing of the hands and feet in a short period of time. [1]

DISCUSSION AND RESULTS

This situation was announced through the mass media and gas was delivered to residential areas, but this was done only in urban areas. However, residents have been continuously suffering from anomalous cold. However, even if some cases were not announced by the mass media, it can be noted that people who entered these buildings to avoid the cold and snow died from the cold.

Maybe it's the building owner's fault. Because they died because they opened the doors of this building before handing it over to the residents. But the reason for this death can be in the people themselves. Because many of the people who died were drunk and their bodies were left in the building for many days after their death. Of course, people are to blame for all such unpleasant events.

According to Elmira Bosithonova, Deputy Minister of Health, severe cold often causes a sharp narrowing of blood vessels. Such unfavorable weather has a negative effect on patients suffering from diseases such as hypertension, atherosclerosis of cerebral blood vessels, post-stroke and heart attack, angina pectoris. They are disturbed by pains in the head and heart. [2]

According to famous British scientists, the main cause of many natural phenomena is people and people's indifference. For example, in the fall, the burning of khazans releases toxic smoke into the atmosphere, and the atmosphere is damaged by the smoke. Atmospheric damage causes warming of the day, reduction of fire occurrence, depletion of the ozone layer and the beginning of drought in the regions.

Poisonous gases released in factories and factories make people sick regularly. That is, the widespread spread of toxic gases is the main reason for the increase and development of lung cancer in our country. According to the data, the cities of Tashkent, Fergana and Almalyk are the cities with the highest level of air pollution.[3]

We have witnessed that in cities like Navoi, Asaka, Ohangaron, as a result of the increase of factories, we can see shortages of hair, eyebrows, nails and similar among local residents. We can see from these events that we, the people, are to blame for all the happenings and events.

Sometimes, eco-journalists think that it is the duty of eco-journalists to cover only natural eco-scapes in mass media. However, this is a misconception. The eco-product that is brought to the public is not only the eco-space videos, but also the main task of an eco-journalist is to warn about the events that occur in nature.

Let's get acquainted with some of these environmental problems: The phenomenon of atmospheric condensation. In recent years, it has become known that the amount of SO₂ in the atmosphere is increasing. As a result, the temperature of the Earth's surface has increased by 0.5-1.0 degrees in the last 100 years. Climate change on a large scale is associated with atmospheric industrial emissions and gases emitted by motor vehicles. Global warming of the Earth's surface, i.e. atmospheric warming, is due to the accumulation of SO₂ gas in the atmosphere from the increase in the composition of SO₂ in the air, deforestation, and the burning of fuels such as coal and gasoline. If the situation does not change, the temperature of the earth's surface may increase by 1.5-4.5 degrees in the middle of the 21st century. [4]

We are witnessing that, along with eco-space videos, coverage of eco-events is the main focus of viewers. Let's assume that the commentary on eco-events given in the mass media (television channel, radio, print edition) will attract people's attention and will be the basis for covering all the tasks based on the opinions about what event will happen today. As a viewer, I can go to work in a comfortable environment by watching today's weather events and feel refreshed throughout the day. It's good for me and my family to be aware of these events every day before it rains, snows or something more serious.

The harmful effects of work on nature and the environment will increase significantly. In the next 100 years, humanity increased its energy resources a thousand times. This allows him to have a serious and far-reaching impact on nature. During the revolution of science and technology, these indicators will increase again. In developed countries, goods and consequences can have far-reaching effects. During the revolution of science and technology, these indicators will increase again. The total volume of goods and services in developed countries now doubles every 15 years. [5]

CONCLUSION

In conclusion, we can say that people should always be aware of such accidents. Because today we live in such a country, we should pay attention to our health. Of course, it is the journalist's duty to cover the eco-catastrophes that are happening today and to be able to clearly convey the information to a sufficient number of listeners. We should not forget that we should always pay attention to our health while living in such a heavenly country.
